Uploading an Excel data to Model Studio Project

Ensure that all the variable names in the Excel file agree with the SAS naming convention before importing the file.

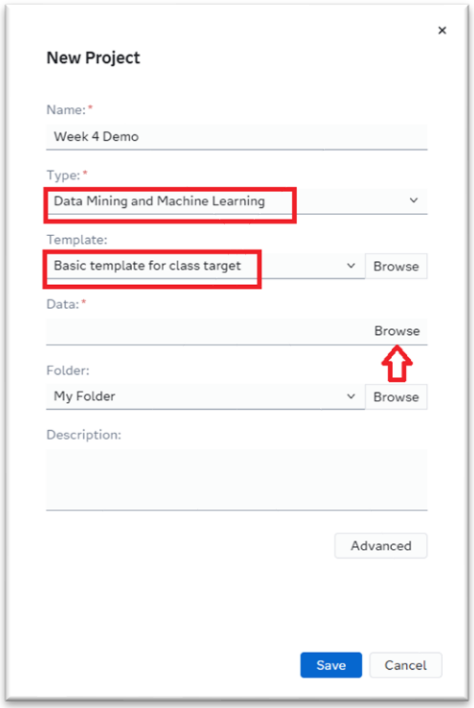

1. Access Model Studio – Build Models.

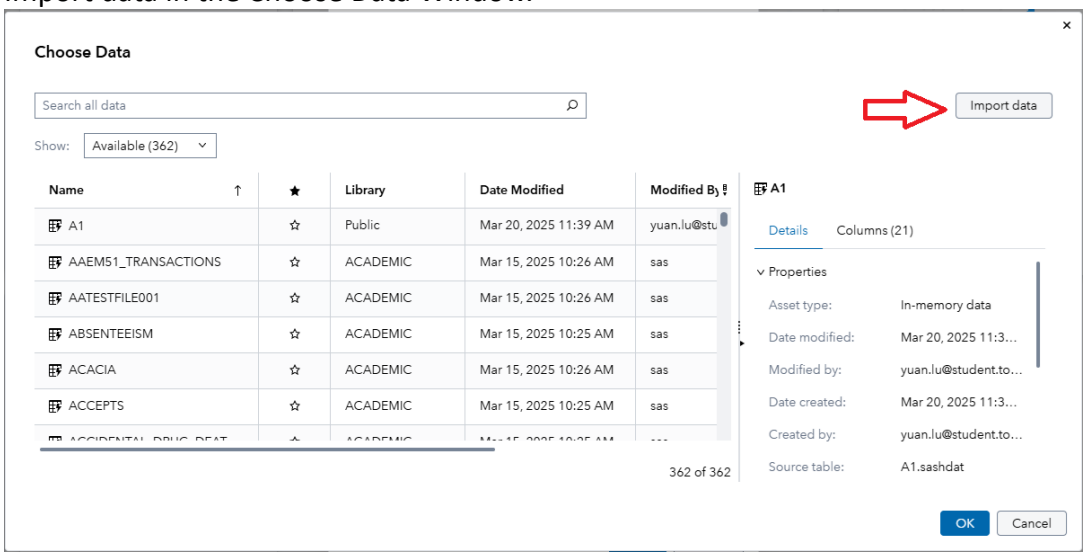

2. Select the New project at the top right of the interface.

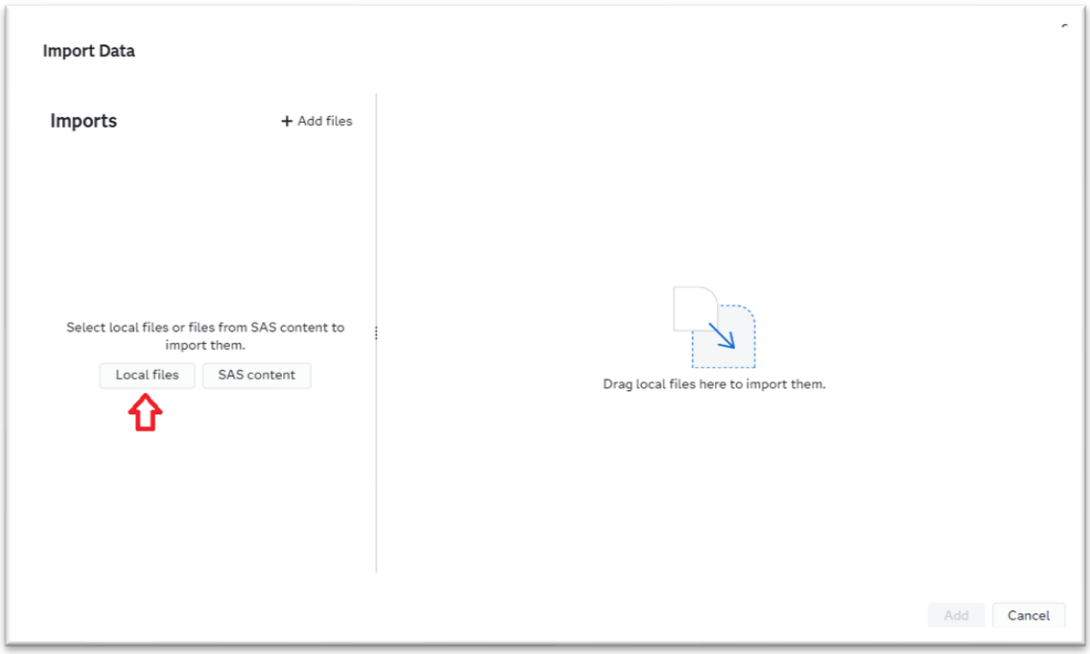

3. Create a Data Mining and Machine Learning Model Studio Project using Basic template for class target.

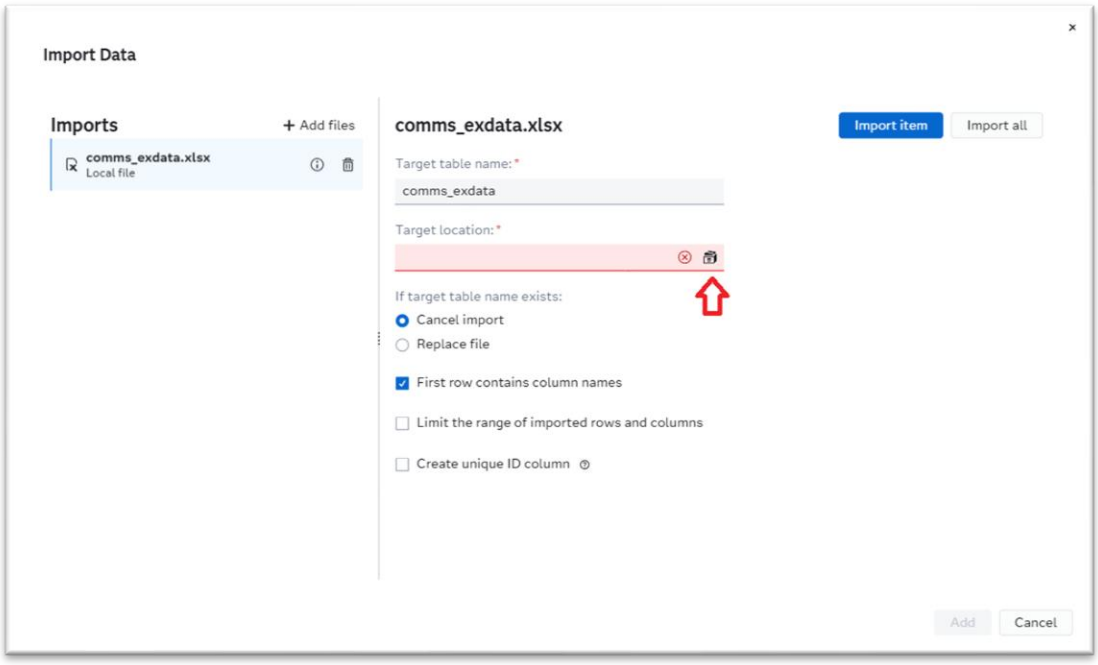

4. Select the Browse at Data column. Then the Choose Data window will pop up. Select Import data in the Choose Data Window.

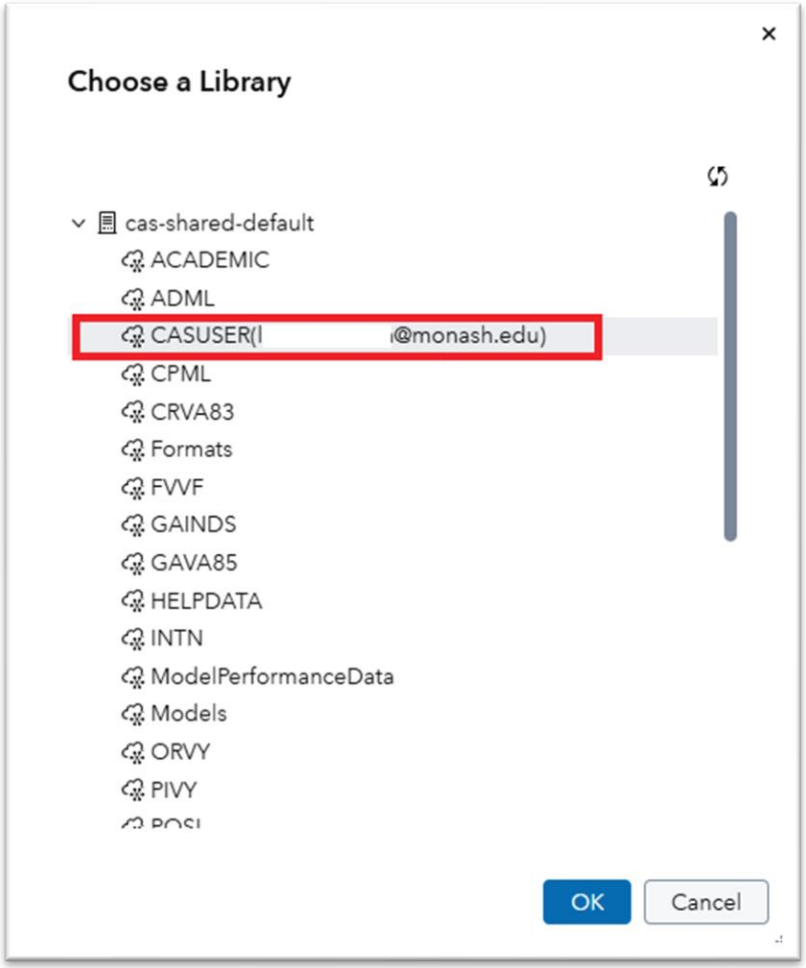

5. Ensure that you have downloaded the comms_exdata Excel table from the Week 4 Moodle page. Identify the location of this Excel file in your local drive. Select Local files in the Import Data window and then open the Excel file.

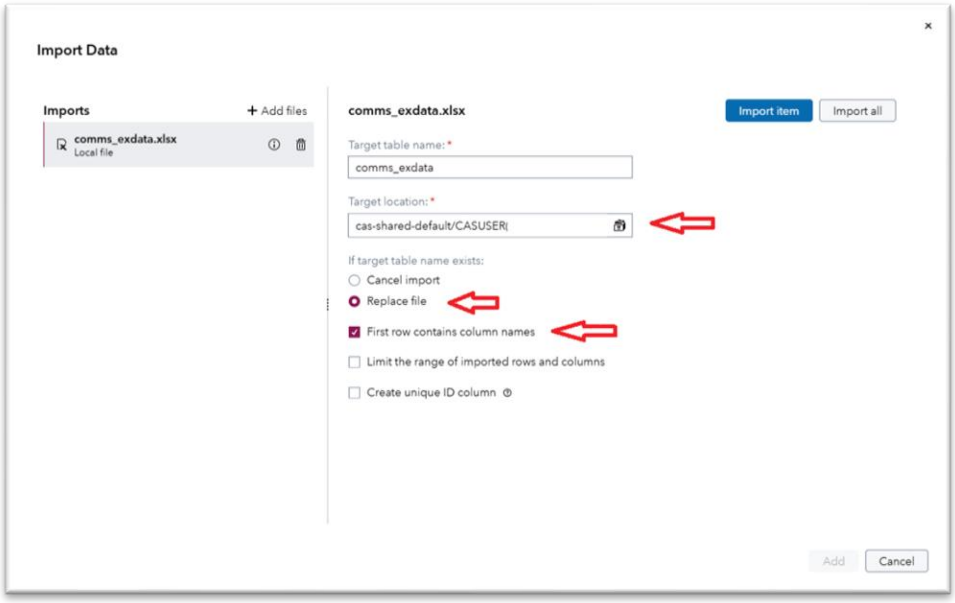

6. Then browse the Target location.

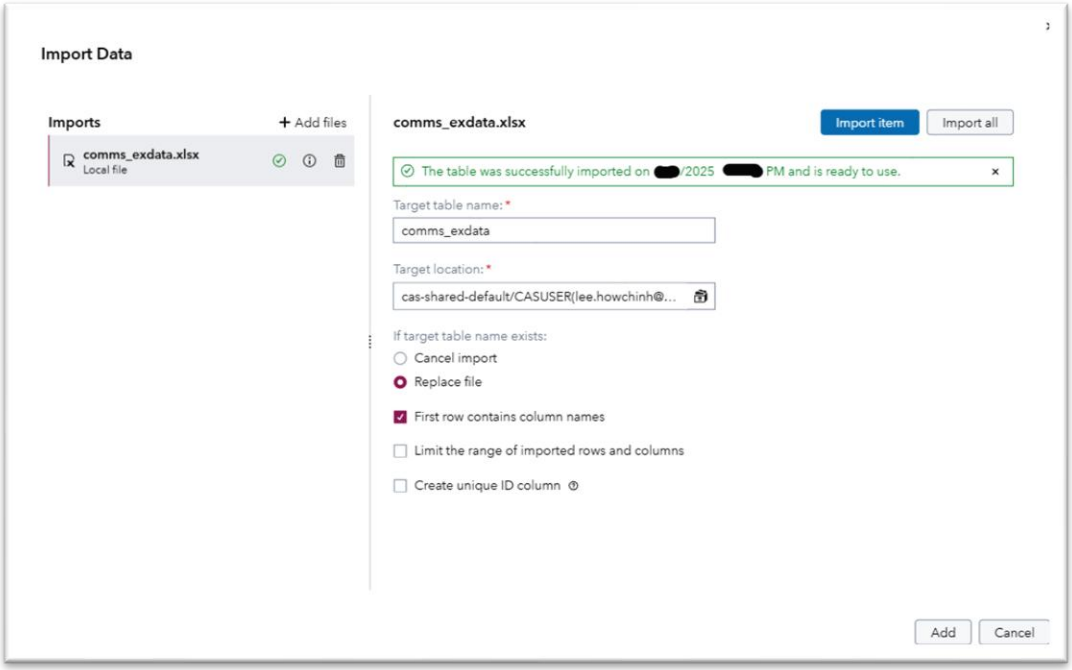

7. Choose the CASUSER library, then select OK.

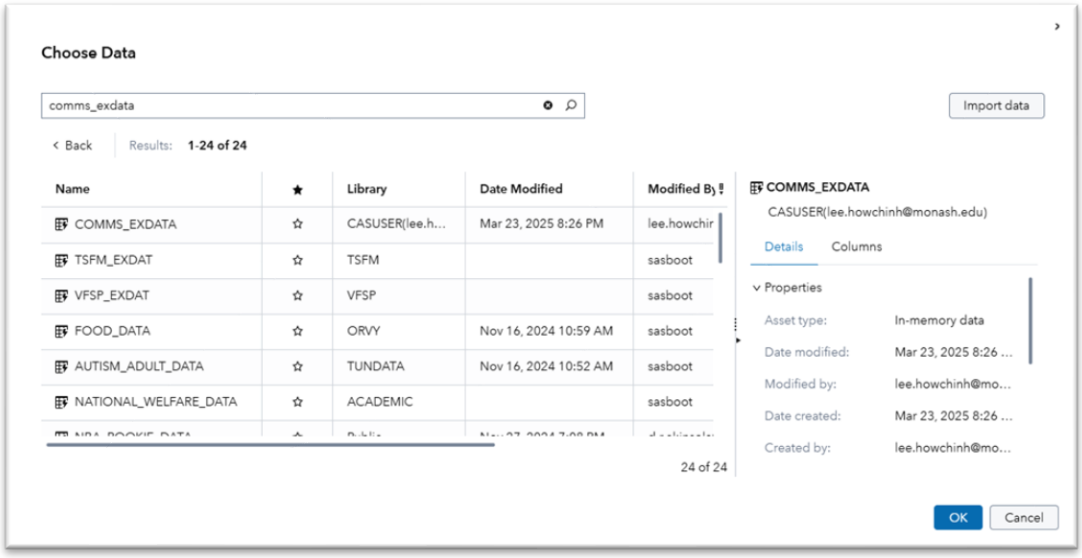

8. Ensure that the options of Replace file and First row contains column names are selected. Then select Impost item button.

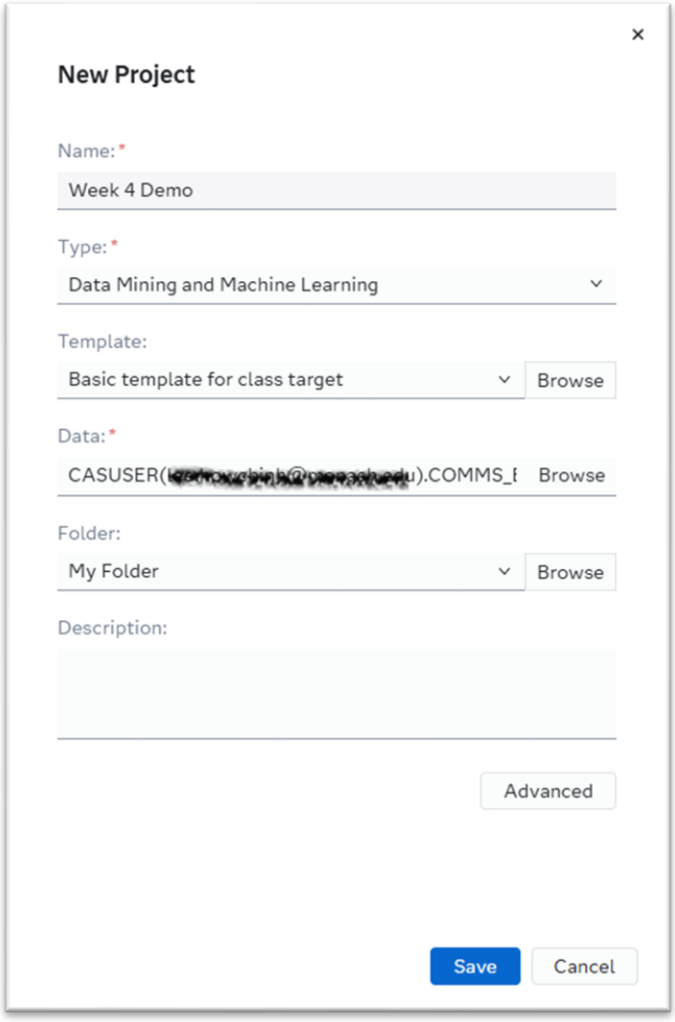

9. A green statement with a tick will be displayed if the table is successfully imported. Select Add button.

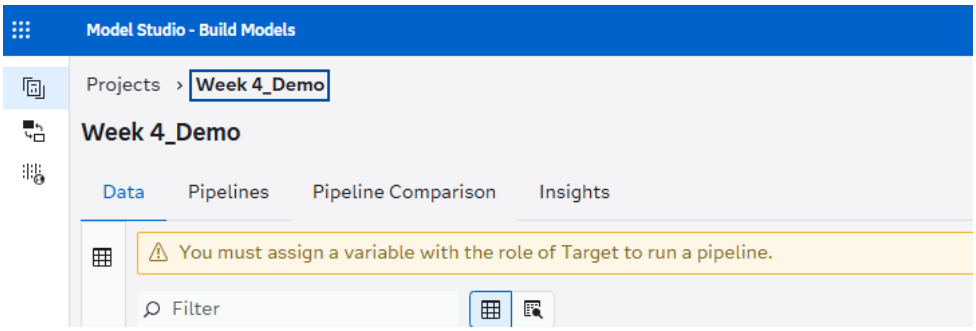

10. Then search the comms_exdata in the Choose Data window. Select the comms_exdata and press OK button.

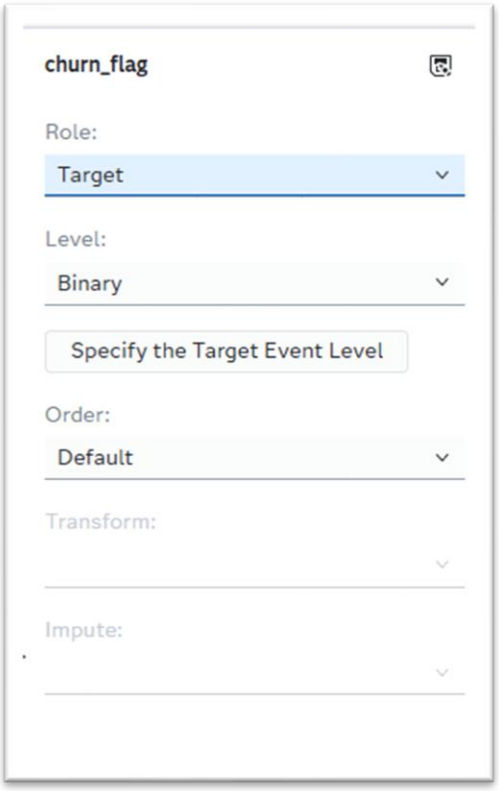

11. Then Select Save in the New Project window.

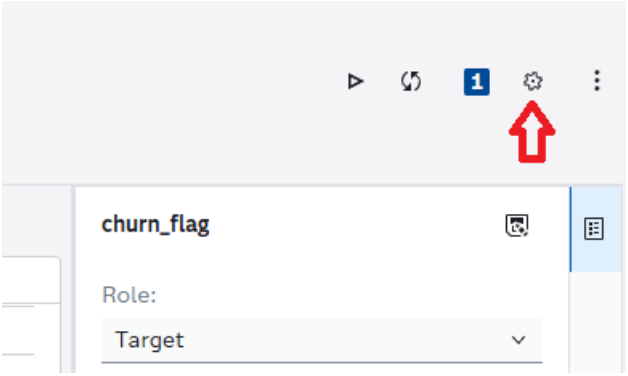

12. You will receive a warning about assigning a target variable as below.

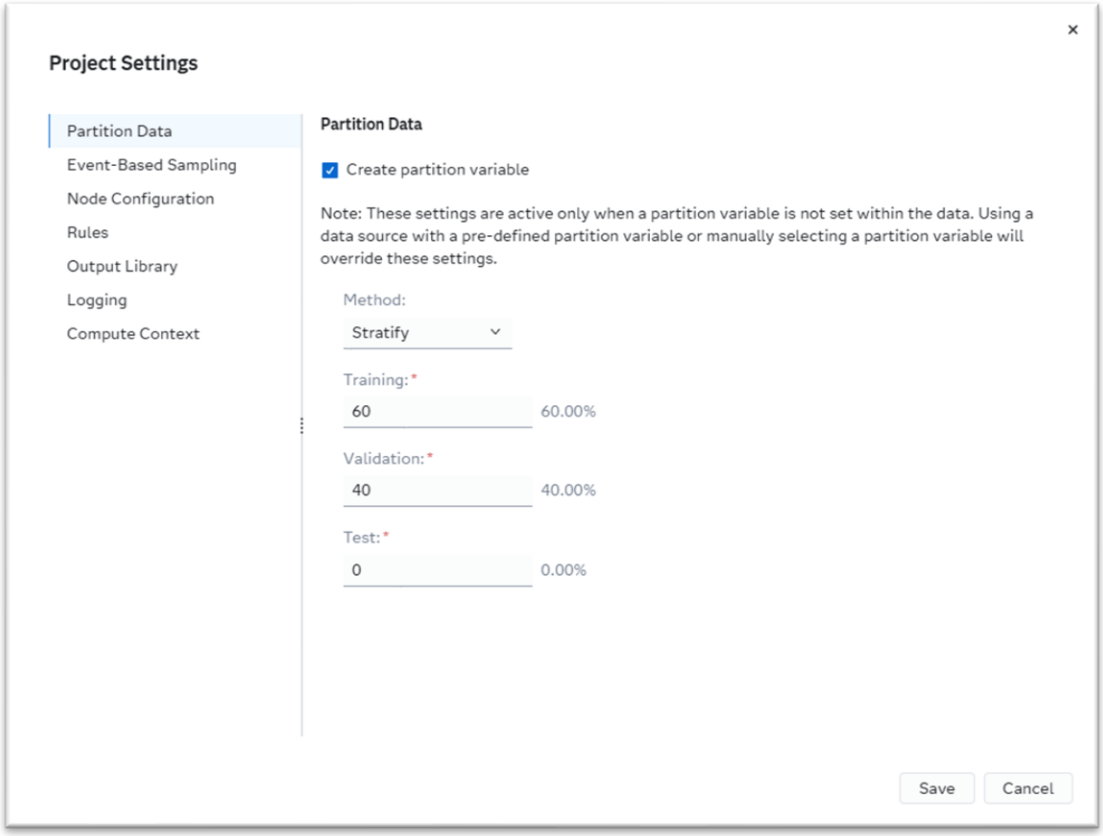

13. Change the variable role of “churn_flag” as Target.

14. Then ensure that the data partition proportion is set before running the pipelines. Go to Project Settings icon at the top right.

15. Then change the proportion of training, validation and test data sets as below.

16. Now, you can explore the pipeline.
